MODERN VEHICLE PACK
RENDER PIPELINE CONVERSION GUIDE

Built-in Render Pipeline / HDRP / URP / Materials / Support

QUICK START

The package is prepared for Unity's Built-in Render Pipeline. If your project uses HDRP or URP, Unity can upgrade the included materials in only a few clicks using the methods shown in this guide.

Support: art_equilibrium.studio@mail.ru

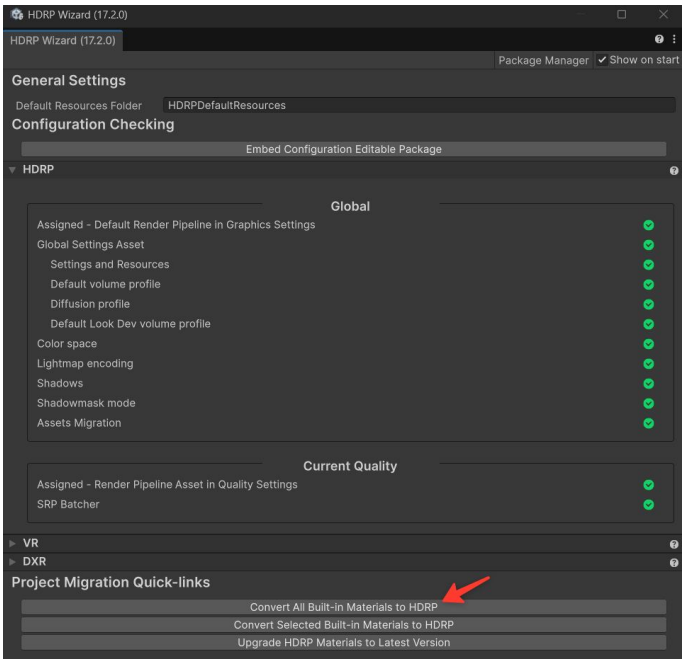

1. HDRP MATERIAL CONVERSION

The package materials are created for Unity's Built-in Render Pipeline. In an HDRP project, use either of the following conversion methods.

1.1 CONVERT ALL MATERIALS

Use the HDRP Wizard when you want Unity to convert every Built-in material in the project.

1. Open the HDRP Wizard.
2. Scroll to Project Migration Quick-links.
3. Click Convert All Built-in Materials to HDRP.
4. Wait for Unity to finish importing and compiling shaders.

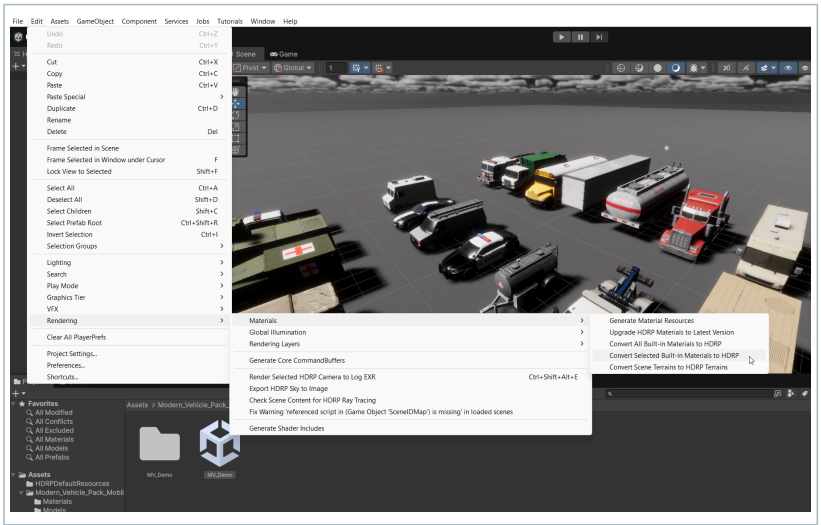

HDRP Wizard: click Convert All Built-in Materials to HDRP.

1.2 CONVERT SELECTED MATERIALS

Use this option when you want to convert only the materials included with this asset.

1. Select the asset's Materials folder or the required material files.
2. Open Edit > Rendering > Materials.
3. Choose Convert Selected Built-in Materials to HDRP.
4. Wait until the material previews and scene shaders update.

Menu path: Edit > Rendering > Materials > Convert Selected Built-in Materials to HDRP.

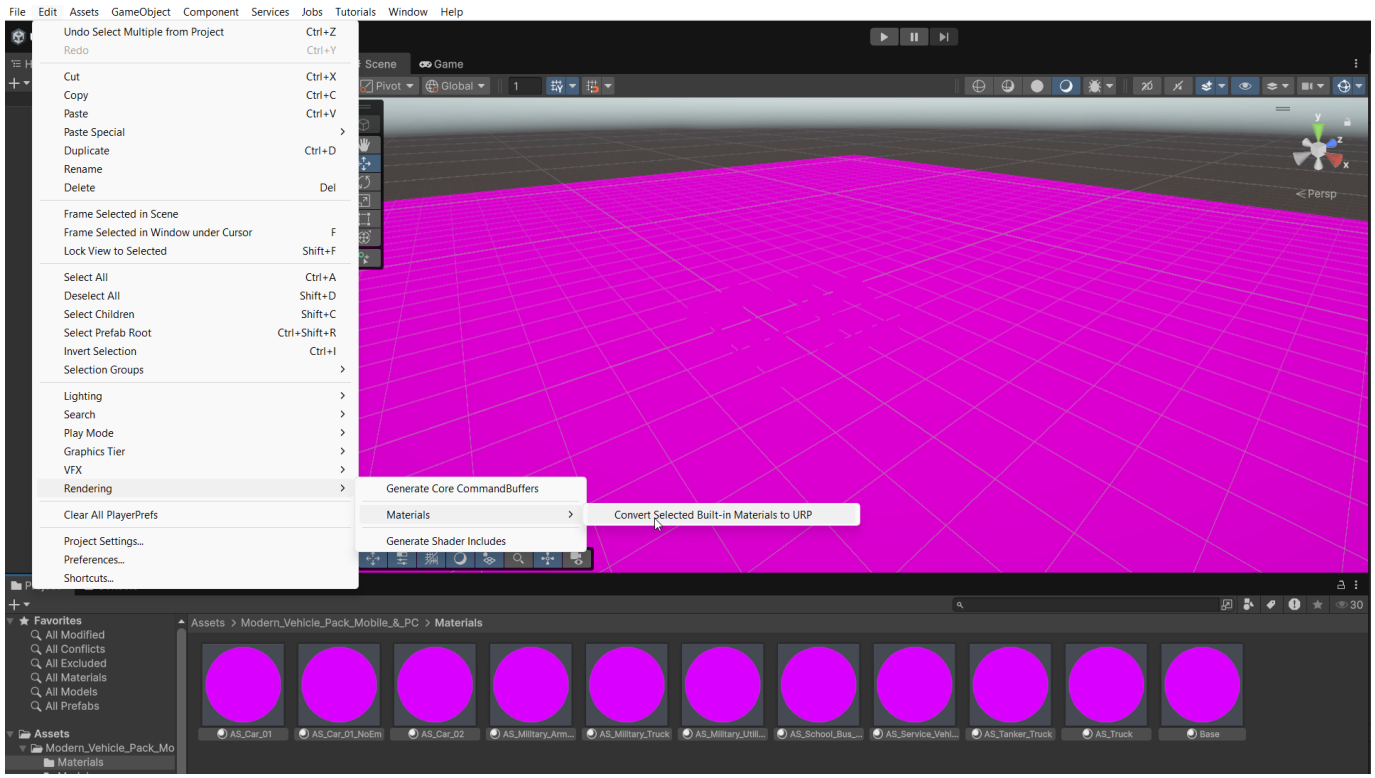

Result After either method, open the demo scene and confirm that the vehicle materials render correctly and are no longer pink.

2. URP MATERIAL CONVERSION

For a Universal Render Pipeline project, select the package materials and run Unity's Built-in-to-URP conversion command.

Steps

1. Select the asset's Materials folder or all required material files in the Project window.
2. Open Edit > Rendering > Materials.
3. Choose Convert Selected Built-in Materials to URP.
4. Wait for Unity to reimport the materials and compile the URP shaders.

Menu path: Edit > Rendering > Materials > Convert Selected Built-in Materials to URP.

If materials remain pink	Confirm that the URP Pipeline Asset is assigned in Graphics and in the active Quality level, then reimport the affected materials.

3. RECOMMENDED USE CASES

The vehicle models are optimized for practical game scenes where many vehicles may be visible at the same time. They are especially suitable for:

MOBILE GAMES	Optimized vehicle assets for scenes that need good readability and controlled performance.
TOP-DOWN / ISOMETRIC	Excellent for ARPG, tactical, management and simulation cameras viewed from above.
STRATEGY GAMES	Suitable for RTS, turn-based strategy, city control and military scenario layouts.
TRAFFIC AND BACKGROUND SCENES	Useful for roads, parking areas, checkpoints, emergency scenes and populated environments.
PC PROJECTS	Can be used on PC as efficient environment vehicles, especially at medium or long camera distance.

Camera recommendation	These models are best used in mobile, top-down, isometric and strategy games, or as environment vehicles viewed from a moderate distance. They are not primarily designed as ultra-close first-person hero vehicles.

4. SUPPORT

If you have questions about importing the asset, converting materials, render pipelines or visual issues, contact:

art_equilibrium.studio@mail.ru

Please include your Unity version, target render pipeline, a screenshot of the issue and a short description of what happened. This helps provide a faster and more accurate solution.

Thank you for using Art Equilibrium assets.
